

Don't Let Colon Cancer Go Undetected

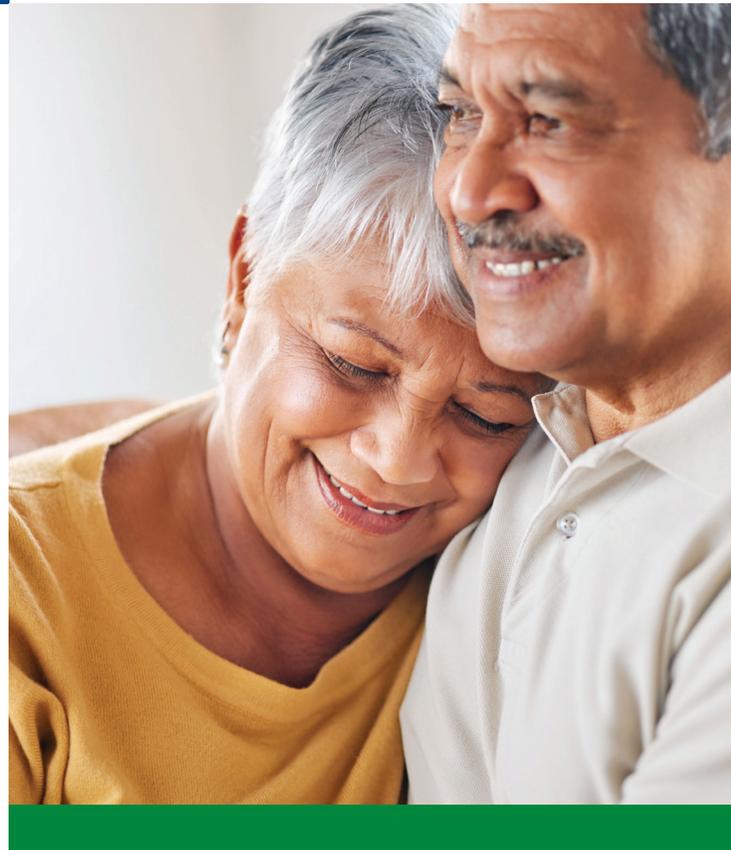

Screening Saves Lives

Colon cancer often develops without early symptoms, and many people feel healthy until it has progressed. Screening can detect precancerous polyps early and identify cancer when it is most treatable.

If you are 45 or older, or younger with risk factors such as a family history, join **Dr. Corey Slominski** and **Dr. Greg Dodge**, physicians at Aspirus Langlade Hospital, to learn why screening matters and how it can save lives.

- Why colon cancer screening matters—even without symptoms
- Who should be screened and current guidelines
- Risk factors and warning signs
- Screening options, including colonoscopy, and what to expect
- How early detection saves lives

Tuesday, March 24, 2026 | 5:30 p.m. - 6:30 p.m.

**Aspirus Langlade Hospital | Demulling Conference Room
112 E. Fifth Avenue, Antigo, WI**

This event is free, but registration is requested.

Call: **800.847.4707**

Visit: **aspirus.org/classes-events**

Take charge of your health.
Screening is prevention.
